Bone Cement for Vertebroplasty & Kyphoplasty
OPACITY+® is a self-curing and ready to use low viscosity bone cement with a very high content of radiopaque agent for a perfect and safety visualization. Its composition has been optimized to get the most suitable handling properties for vertebroplasty & kyphoplasty.

Indications

The OPACITY+® is indicated for the fixation of pathological fractures of the vertebral body using vertebroplasty or kyphoplasty procedures. Painful vertebral compression fractures of the vertebral body may result from osteoporosis, benign lesions (hemangioma), or malignant lesions (metastatic cancers, myeloma).

Specification of use

The viscosity of Opacity+®, specifically designed for vertebroplasty offers outstanding advantages:

- The well adapted rheology allows optimal injection time giving peace of mind to the clinician.
- When following the recommended application phase, the implantation of Opacity+® within its pasty phase will offer:
  - A good penetration into spongious tissues without leakage
  - An optimal distribution of the volume of cement into the vertebra.

Technical data & clinical cases:

The high radio-opacity offers a comfortable visual control during cement application. The viscosity of Opacity+® allows a simple filling of bone and is recommended in all cases.
Storage

The cement is to be stored in its original, unopened packaging, in a dry, clean place, away from light and at a temperature of 25°C max.

Products

Each dose of Opacity+® contains two sterile components. A pouch of powder and a ampoule of liquid monomer.

Single use only. For any further information, please refer to the IFU.
