I.V. POLE

Secure and stable stainless-steel design

I.V. poles are essential equipment wherever an I.V. needs to be administered. They are designed to hold a bag of fluid or medicine that is being delivered intravenously to hospital patients at a steady flow.

The Medstor stainless steel I.V. pole comes with a choice of two and four hook configurations to suit the needs of the clinical team.

The fully mobile base enables the I.V. pole to be taken directly to hospital wards and treatment rooms, allowing it to be quickly in use at the point of care.

It also has a simple and easily deployed handwheel height adjustment, so can be swiftly set to the height required.

Robust stainless steel construction makes the I.V. pole easy to clean, in line with hospital infection prevention and control practices.

Conform to the European Directives

Medical Device Directive 92/42/EEC-Class 1
BS3619-1976 Stability Test.

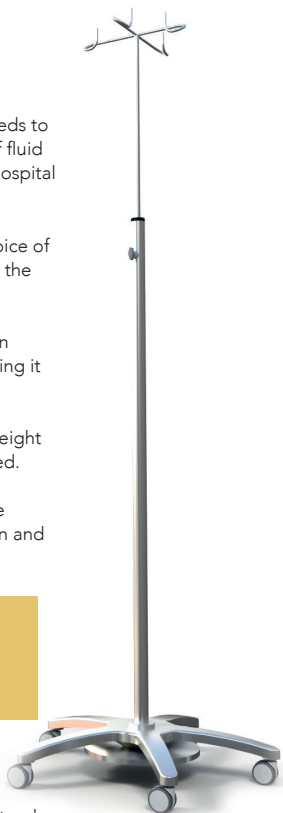

Code

Description
